

# AI-103 Group Project

Your guide to submission and presentation

Chitkara University | 14 – 25 September 2026

As part of the AI-103 programme, you will work in a small team to build an AI project that solves a real, practical problem using what you learn during the course. This is a course-completion project, not a hackathon and not a competition — you are not being ranked against other teams. What matters is that you apply AI-103 concepts properly, build something that works, and can explain how you built it.

**In one line:** pick a real problem, build a working AI solution using Azure AI services, document it on GitHub, record a 5-minute video, and present it in front of the class.

## Key dates at a glance

| Date                     | What has to happen                                                                                                                        |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Before 14 September 2026 | Register your team: member names, group details and your chosen project topic.                                                            |
| 14 – 23 September 2026   | Build your project alongside the AI-103 sessions.                                                                                         |
| Before the deadline      | Submit your GitHub repository link and the YouTube link to your 5-minute project video through the Project Submission section in the LMS. |
| 24 – 25 September 2026   | Final project presentations, conducted during regular class hours.                                                                        |

## 1. Team rules

- **Group size.** Minimum 4 students, maximum 5. Teams outside this range will not be accepted.
- **Azure access.** At least one member must have the Microsoft Azure for Students \$100 benefit. You need it to run Azure AI services — activate it early, do not leave it to the last week.
- **Registration deadline.** Team member names, group details and your project selection must be submitted by 14 September 2026.

## 2. What you have to submit

Three deliverables. All three are required.

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>A. Working prototype or PoC</b> | Build something that actually runs. It need not be finished, but it must demonstrate the core functionality end to end and make four things obvious: the problem you are solving, how AI is used to solve it, which AI-103 concepts you applied, and a technical workflow you can demonstrate live.                                                                                                                                            |
| <b>B. GitHub repository</b>        | Source code plus a README.md covering: project title and team members; problem statement and solution overview; solution architecture or data flow; technology stack and the AI services or models used; setup instructions; testing and results; known limitations and future improvements. Keep code readable, logically structured and commented where the logic is not obvious. Acknowledge third-party libraries, datasets and resources. |
| <b>C. 5-minute video</b>           | Record a presentation of no more than 5 minutes, upload it to YouTube, and submit the link through the Project Submission section in the LMS. Minimum 720p (1080p preferred); MP4, MOV or AVI. Check the sharing permissions — the link must stay accessible for viewers.                                                                                                                                                                      |

**Important:** never upload passwords, API keys, tokens, connection strings or any other credentials to your repository. Use environment variables or configuration files that are excluded from Git.

### 3. How to structure your 5-minute video

| Section                 | Time   | What to cover                                                   |
|-------------------------|--------|-----------------------------------------------------------------|
| Introduction            | 30 sec | Your team, project title and use case                           |
| Problem statement       | 30 sec | The problem or opportunity you are addressing                   |
| AI-driven solution      | 1 min  | Your solution approach and the AI technologies or services used |
| Technical demonstration | 2 min  | Show your working prototype or proof of concept                 |
| Impact & future scope   | 1 min  | Value delivered, limitations, scalability and next steps        |

### 4. Presentation day

Final presentations and evaluation take place on 24 – 25 September 2026, during regular class hours, after the AI-103 instructional sessions are complete. In front of the class, your team should be ready to explain the problem, your solution architecture and the AI technologies used; demonstrate the prototype working; discuss your technical decisions, testing, limitations and future improvements; and answer questions from your classmates and the instructor.

**Note on AI tools:** you are allowed to use AI assistants while building. But you must be able to explain every part of what you submit, including anything generated with AI help. If you cannot explain it, do not submit it.

### 5. How you will be evaluated

| Evaluation area                            | Weight | Evaluation area                   | Weight |
|--------------------------------------------|--------|-----------------------------------|--------|
| Problem definition and use-case relevance  | 10%    | Documentation and code quality    | 10%    |
| Application of AI-103 concepts             | 25%    | Demonstration and presentation    | 10%    |
| Technical implementation and functionality | 25%    | Practical impact and future scope | 5%     |
| Testing, reliability and responsible AI    | 15%    | Total                             | 100%   |

**What this tells you:** half the marks sit in applying AI-103 concepts and implementing them well. A simple idea that is built properly and explained clearly will score better than an ambitious idea that does not work.

### 6. Code, originality and responsible AI

- **Code and documentation.** Clear naming conventions, clean modular code, a logical file structure, and meaningful comments for non-obvious logic.
- **Originality.** The project must be your team's own work. You may use open-source resources, APIs, datasets and AI-assisted development tools — but any significant third-party resource must be acknowledged.
- **Responsible AI.** Consider privacy, security, fairness, transparency, reliability and human oversight in your solution, and be ready to talk about them. Plagiarised, offensive, discriminatory or otherwise inappropriate submissions may be rejected.

## 7. Final checklist

- ☐ Working prototype or PoC ready to demonstrate
- ☐ GitHub repository is accessible
- ☐ README and technical documentation complete
- ☐ 5-minute video finished and on YouTube
- ☐ All links and sharing permissions tested
- ☐ Team member information is correct
- ☐ Third-party resources are acknowledged
- ☐ No passwords, API keys or credentials exposed
- ☐ Submission completed before the deadline

**Late or materially incomplete submissions may not be considered for evaluation.**

## 8. Suggested project topics

Starting points, not fixed assignments — narrow your choice to a clear problem statement you can build and demonstrate in the time available.

| #  | Project topic                    | Primary AI-103 capabilities         | Possible Microsoft Azure / Foundry components |
|----|----------------------------------|-------------------------------------|-----------------------------------------------|
| 1  | AI Study Assistant               | GenAI, RAG, agent, tools            | Microsoft Foundry, Foundry IQ, AI Search      |
| 2  | University Student Support Agent | Agent, tools, RAG                   | Microsoft Foundry, custom tools, Foundry IQ   |
| 3  | HR Policy Assistant              | RAG, agent, responsible AI          | Microsoft Foundry, Foundry IQ, AI Search      |
| 4  | AI Recruitment Assistant         | GenAI, text analysis, agent         | Microsoft Foundry, Azure AI Language          |
| 5  | Employee Onboarding Agent        | Agent, workflows, knowledge         | Microsoft Foundry, Foundry IQ                 |
| 6  | Meeting Assistant                | GenAI, text analysis, speech        | Microsoft Foundry, Azure AI Language, Speech  |
| 7  | Customer Support Agent           | Agent, tools, RAG                   | Microsoft Foundry, custom tools, Foundry IQ   |
| 8  | IT Helpdesk Agent                | Agent, tools, knowledge             | Microsoft Foundry, custom tools, AI Search    |
| 9  | University FAQ Multi-Agent       | Multi-agent, RAG, orchestration     | Agent Framework, Foundry IQ, AI Search        |
| 10 | Product Documentation Assistant  | RAG, agent, knowledge mining        | Foundry IQ, Azure AI Search                   |
| 11 | Research Paper Assistant         | RAG, multimodal / document analysis | AI Search, Content Understanding, Foundry     |
| 12 | Course Content Assistant         | RAG, agent                          | Foundry IQ, AI Search                         |
| 13 | Invoice Processing Assistant     | Document / content extraction       | Content Understanding, AI Search              |
| 14 | Resume Analyzer                  | Text analysis, GenAI, extraction    | Azure AI Language, Content Understanding      |
| 15 | Visual Product Assistant         | Vision, multimodal, GenAI           | Microsoft Foundry, Content Understanding      |
| 16 | AI Document Analyzer             | Content Understanding, RAG          | Content Understanding, AI Search              |
| 17 | Multimodal Learning Assistant    | Vision, GenAI, RAG                  | Content Understanding, Foundry, AI Search     |
| 18 | Voice-Based University Assistant | Agent, speech, knowledge            | Speech, Microsoft Foundry, Foundry IQ         |
| 19 | AI Interview Coach               | Speech, GenAI, agent                | Azure AI Speech, Microsoft Foundry            |
| 20 | Language Translation Assistant   | Translation, speech                 | Azure AI Language, Speech                     |
| 21 | Voice Customer Support Agent     | Voice, agent, tools                 | Voice Live Agent, Microsoft Foundry           |
| 22 | AI Language Learning Assistant   | Language, speech, translation       | Azure AI Language, Speech                     |
| 23 | Voice IT Helpdesk Agent          | Speech, agent, tools                | Speech MCP, Microsoft Foundry                 |
| 24 | AI Image Description Assistant   | Vision, multimodal GenAI            | Microsoft Foundry, Content Understanding      |
| 25 | AI Video Insight Assistant       | Video, Content Understanding        | Azure Content Understanding                   |
| 26 | Smart Media Analysis Agent       | Multimodal, agent, RAG              | Content Understanding, Foundry, AI Search     |
| 27 | Knowledge Mining Assistant       | AI Search, extraction, RAG          | Azure AI Search, Content Understanding        |
| 28 | Enterprise Knowledge Agent       | RAG, tools, agent                   | Foundry IQ, AI Search, MCP                    |
| 29 | Multi-Agent Business Assistant   | Multi-agent, orchestration, tools   | Agent Framework, A2A, Microsoft Foundry       |
| 30 | Campus Placement Assistant       | Agent, RAG, tools                   | Microsoft Foundry, Foundry IQ, AI Search      |

**Before you present, make sure your team can answer these four questions:**

1. What problem did we solve?
2. What did we build?
3. How did we apply our AI-103 learning?
4. Can we demonstrate that it works?
